A Little About My Business

Owner of Smell the Roses Memory Creation LLC

17 years of experience

I started exploring digital photography and editing in 2008

Roughly 11,000 photos edited and sent to happy clients

Since October 2021 when I opened my business

Awards

2nd Place Best of Mankato 2022 Published in Multiple Magazines

Tips and Tricks Overview:

- 1) Composition
- 2) Lighting
- 3) Storing
- 4) Digital Editing

Tip #1 Composition: The way you arrange the elements of the photo within the frame

Natural Framing- Use the environment to frame your subject

Filling the Frame- Be mindful about what is in your camera's view when taking photos. Keep distractions out of the way so your subject is the main focus, and fill the space with an interesting background

Viewpoint- Playing around with angles and where you stand while taking the photo will change how viewers will perceive the photo **Depth-** Create layers in your photo by placing objects in the foreground and background around your subject.

The Rule of Thirds- The rule of thirds is based on the idea that the human eye is naturally drawn to points of interest that are off-center.

Center- When placing subjects in the center of your photos, use symmetries, leading lines, natural framing, negative space, and minimalism to create a more interesting photo

Tip #2 Lighting: The way the subject is illuminated in a photo

Create Mood & Atmosphere- Use light to incorporate shadows, draw attention to specific parts of your composition, and make your subjects stand out

Backlight Subjects Outdoors- Avoid harsh sunlight and shadows by placing the sun behind your subjects

Use Windows and Natural Light Indoors-The more natural light you can use inside, the more natural your photos will look **Find Even Light**- Find spots of even shade so there aren't sunlight dapples on your subject's face. Overcast days are great for this!

Hard vs Soft Light- Hard light creates harsher shadows, while soft light creates softer shadows

Golden Hour- The sweet spot for taking photos, usually an hour or so before and after sunrise/sunset

Tip #3 Storing Photos: Digital Cameras

Capture Store Locate

When I capture an image on my camera, it is saved to a MicroSD card.

I make folders for every session on my hard drive, Google Drive, and Lightroom

I upload photos to my computer, then each of those places, dragging them from the card to the desired location

After editing, I create another folder for the finished photos and be sure to name the folder and photos so that I can easily find them!

Locating photos for me depends on what I need them for

If I am editing, I use the folders in my Lightroom

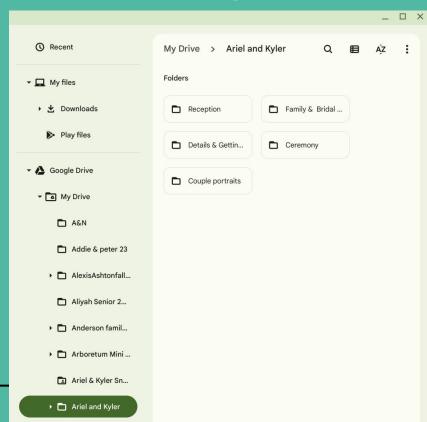

If I am merely searching for a folder, I go to my hard drive or Google Drive!

Tip #3 Storing Photos: Other Ways

Capture Store Locate Save it to your device-You may also capture a photo depending on the device, you Using the search option on using your smartphone, or may need to press and hold your computer or smartphone, search for the name of the receive it by email, text, or on the photo or right click it to other ways! folder so you can easily find save it your photo Create folders for your images on your smartphone or computer, naming them so you can easily find them. Examples "Family photos 2023" Or "kitten photos"

Tip #3 Storing Photos: Visuals

Tip #4 Digital Editing: How to enhance your photos to make the colors and lighting pop

Exposure- The amount of light that reaches the camera's sensor, affecting the brightness of a photo

Highlights, Shadows, Brightness- The more intricate parts of lighting and exposure when editing

Cropping- Cropping is a useful tool to straighten and change the composition of your photos

Contrast- The difference between the lightest and darkest parts of the images

Saturation- The amount and vibrancy of colors in the photo

Warmth & Tint- Can be used to correct the colors of a photo

Practice Time!

Feel free to get out your smartphone or camera and use it to practice some things we have been talking about!

Feel free to ask questions!
